To all new staff,

Welcome to the BBC chemical archaeology department. I hope you have settled in and everything is running smoothly. I trust you all had a good Christmas break.

Anyway, its time to get started on getting this programme together. I have arranged a meeting for the end of the week for all new teams to present their re-enactment scenario. What I think would make a good, interesting show is:

- An introduction showing how Chris Ewans decided what sort of pharmacophore he would make. You should explain how the evidence from the historical documents supports the choice.
- A synthetic outline for the compound from simple materials that he will have had present in the ships chemical supplies.
- A description of the types of chemical technology he would have had to analyse and make his compounds. Make this as historically accurate as you can.
- A short speil on how he may have tested his compound.

Please find attached all the information that was left in the archives after the British Museum fire of 2057. I know its not much to go on, but I am sure you can develop a chemically plausible story.

Anyway, look forward to seeing all your reports at the end of the week. I would like to know what you have made of the little information we have,

George
(Director, Chemical Archaeology department)
